

Strategic Framework for
Controllers Engineering and
Ledger Transformation

This is not a
data migration.
It is a financial
control
transformation.

Technology
Objective

Consolidate to
Oracle Cloud GL.

Business
Objective

Trusted books, faster close,
stronger regulatory lineage,
lower operational risk, and a
foundation for AI-enabled
finance.

Controllers Engineering sits at the intersection of finance, risk, and regulatory compliance

Transaction detail rolls up systematically into the official book of record

Diverse regulatory filings demand precise cuts of the exact same financial data

Legacy fragmentation creates unmanageable operational risk and audit friction

The Catalyst: Legacy Technical Debt

- 🔗 **Fragmented Ledgers:** Multiple GL instances across DB2/Sybase; product-specific sub-ledgers.
- 🗄️ **Duplicated Logic:** Accounting rules buried in mainframe code, ETL jobs, and un-governed Excel spreadsheets.
- 🔍 **Weak Lineage:** Inability to trace regulatory report lines back to source transactions without manual evidence gathering.
- 🕒 **The Impact:** Multiple versions of truth, severely slowed financial close, high reconciliation costs, and systemic audit friction.

The target state establishes Oracle Cloud GL as the governed financial core

The path to the cloud requires establishing a robust coexistence architecture

We cut over only when verifiable control gates are met in parallel run

Architectural guardrails ensure we do not break historical financial logic

Operational continuity dictates a finance-led, heavily governed transition

Generative AI accelerates the migration without owning the financial truth

Legacy Discovery

AI analyzes decades-old mainframe code, summarizes stored procedures, and identifies undocumented accounting rules.

Data Mapping

Suggests chart of accounts mappings and detects anomalies between legacy and target hierarchies.

Reconciliation & Testing

Classifies breaks, generates synthetic test scenarios, and identifies edge cases.

The Vital Control Rule: AI should not own financial truth. Human review, accounting policy validation, and deterministic regression testing are mandatory.

A unified operating model aligns finance, risk, technology, and audit

The ultimate objective is a highly automated, AI-assisted controller ecosystem

Business Metrics

Reduction in close cycle time, elimination of spreadsheet-controlled processes, and faster regulatory report preparation.

Technology Metrics

Successful legacy decommissioning, automated reconciliation coverage, and comprehensive source-to-report lineage.

Risk & Control Metrics

Zero unresolved material breaks, reduced audit findings, and minimal manual adjustments post-close.

The Future State:
A semantic finance layer
enabling an
**'AI-Assisted Controller
Controller Copilot'**
capable of instantly
explaining legal entity
balance sheet
movements and drafting
close commentary.
